Adaptive robust H infinity control for nonlinear systems ...

The adaptive controller consists of an H_∞ suboptimal control law and a robust parameter estimator. Stability and robustness analysis is based on a general frozen time analysis framework. Global boundedness of the adaptive control system in the presence of parametric uncertainty, unmodeled dynamics, and bounded noises is proved.

Adaptive Robust Control Systems | IntechOpen

H^∞ (i.e. "H-infinity") methods are used in control theory to synthesize controllers to achieve stabilization with guaranteed performance. To use H^∞ methods, a control designer expresses the control problem as a mathematical optimization problem and then finds the controller that solves this optimization. H^∞ techniques have the advantage over classical control techniques in that H ...

Robust-and-Adaptive-Control For a class in Robust & Adaptive Control, I created Matlab implementations of LQR, RSLQR, H-infinity, and LQGLTR state-feedback controllers. Further built into these implementations are extensive time-domain and frequency domain analyses, along with useful frameworks for using these analyses to determine optimal gains.

Adaptive Robust H Infinity Control For Nonlinear Systems

This paper proposes a robust H-infinity control design of a single unit differential type Wheeled Mobile Robot. Mobile robots are non holonomic systems as their constraint equations are not integrable. Considering the constraints and combining the kinematics and dynamics of the system, a linearized model is obtained. Taking into account the exogenous inputs in the form of model uncertainties ...

An H infinity adaptive fuzzy control design is proposed in this paper for unknown nonlinear networked systems. The main issues of networked systems are addressed here, which are the system delay and loss of information. In fact, the proposed method overcomes the delays by filtering the errors and also compensates the loss of system information.
