The deficiency in NO biosignalling in CPL hearts may arise due to acidosis-induced inhibition of NOS activity, reduced availability of GTP and/or enhanced inactivation of NO by superoxide. These findings provide rationales for novel strategies to prevent the deficiency in NO biosignalling and so improve the function of the transplanted heart.

WNT signaling is an elaborate and complex collection of signal transduction pathways mediated by multiple signaling molecules.

WNT signaling is critically important for developmental processes, including cell proliferation, differentiation and tissue patterning. Little

Opportunities abound for research training in Vascular and Cardiac Biology. UCSF's Cardiovascular Research Institute (CVRI) both provides a home for such research and fosters interactions among investigators throughout UCSF who are interested in cardiovascular biology and disease. The spectrum of investigation ranges from basic structural
