Enhancing Drug Bioavailability and Solubility. Approximately 40% of drugs on the market place and a high percentage of APIs in development are poorly soluble. Optimization of drug solubility and BA of therapeutics stands as one of the top challenges faced by the pharmaceutical and biotech industry today. A number of new chemical entities (NCEs) and new biological entities (NBEs) in clinical development are facing challenges in late phase of development (Phase II) due to a poor release ...

For reasons of convenience for the patient and compliance to the therapy, most drugs are administered orally. To keep the dose at the lowest possible level, high oral absorption and high bioavailability are prime properties to optimize in a new drug. Drug bioavailability is the outcome of a complex chain of events, and is among others influenced by the drug's solubility, permeability through the gastrointestinal wall, and its first-pass gut wall and liver metabolism. Excluding liver metabolism, all

Drug bioavailability : estimation of solubility, permeability, absorption and bioavailability. [Han van de Waterbeemd; Hans Lennernas; Per Artursson;] -- The peroral application (swallowing) of a medicine means that the body must first resorb the active substance before it can begin to take effect.

Drug bioavailability : estimation of solubility ...

Bioavailability is a parameter that is highly dependent on solubility, permeability, and clearance; moreover, all three parameters, in turn, depend on lipophilicity. Thus, there is a defined role of lipophilicity on bioavailability.

Importance of Solubility and Lipophilicity in Drug Development

Biopharmaceutical classification system (BCS) is a drug development tool that is based on correlation of solubility with their bioavailability in human body and allows estimation of the contributions of three major factors, dissolution, solubility, and intestinal permeability, which affect oral drug absorption from immediate release (IR) solid oral products.

Biological classification system (BCS): with a new ...

Solubility is based on the highest-dose strength of an immediate release product. A drug is considered highly soluble when the highest dose strength is soluble in 250 mL or less of aqueous media over the pH range of 1 to 7.5.
