Interpretation Of Mass Spectra Of

Mass spectral interpretation is the method employed to identify the chemical formula, characteristic fragment patterns and possible fragment ions from the mass spectra. Mass spectra is a plot of relative abundance against mass-to-charge ratio. It is commonly used for the identification of organic compounds from electron ionization mass spectrometry. Organic chemists obtain mass spectra of chemical compounds as part of structure elucidation and the analysis is part of many organic chemistry curri

The pattern of lines in the mass spectrum of an organic compound tells you something quite different from the pattern of lines in the mass spectrum of an element. With an element, each line represents a different isotope of that element. With a compound, each line represents a different fragment produced when the molecular ion breaks up.

A coincidental rule is that the number of nitrogen atoms in all molecules is related to the number of even or odd mass numbers of molecular ions, known as the “nitrogen rule” in mass spectrometry. The mass number of the mass spectrum fragments containing nitrogen atoms or even nitrogen atoms must be odd.

Interpretation of Mass Spectra: Fred W. McLafferty ...

Mass spectrometry (MS) is a proven analytical method used to glean information about the chemical structure of a chemical sample. MS is applied to fields as disparate as airport security, food and wine analysis, drug and explosives analysis, as well as most fields of chemical and biological research.

The Nature of Mass Spectra A mass spectrum will usually be presented as a vertical bar graph, in which each bar represents an ion having a specific mass-to-charge ratio (m/z) and the length of the bar indicates the relative abundance of the ion. The most intense ion is assigned an abundance of 100, and it is referred to as the base peak.

Interpretation of Mass Spectra - Analytical Training Solutions

For the analytical chemist, a mass spectrum is useful for two applications. The first is the relatively simple case when the analyst is looking for a particular compound in a sample and has a reference material to compare spectra. The second occurs when an analyst observes the presence of an unknown and wishes to identify it.
