Load Flow Analysis Using Matlab

Implementation of Gauss Seidel Power Flow Solution in MATLAB. This is the general program for solution, it has 2 test cases (the 6 and 9 ieee bus systems) but can be accurately used in other power systems, just enter the data in tables , e.g (line & bus). The program computes the admittance matrix Ybus and computes V and Theta using the Gauss Seidel method, then, the load flows are calculated.

The Load-Flow Analyzer app performs a load-flow, or power-flow, analysis for a three-phase AC electrical power transmission system that you model and configure for analysis using Simscape™ Electrical™. The app generates two tables. One of the tables contains data for the network nodes, as represented by busbar, load flow source, synchronous machine, induction machine, and three-phase load blocks.
