### What Is The Optimal Solution

An optimal solution is the best business approach to a problem, creating the most profit for the least expense. It may take some tinkering and planning to arrive upon the optimal solution, but any changes beyond that point would make it less effective. Businesses work to achieve optimal

### What Is The Optimal Solution

In mathematics, computer science and economics, an optimization problem is the problem of finding the best solution from all feasible solutions.. Optimization problems can be divided into two categories, depending on whether the variables are continuous or discrete: . An optimization problem with discrete variables is known as a discrete optimization, in which an object such as an integer ...

### **Optimal Solution**

In applied mathematics and computer science, a local optimum of an optimization problem is a solution that is optimal (either maximal or minimal) within a neighboring set of candidate solutions. This is in contrast to a global optimum, which is the optimal solution among all possible solutions, not just those in a particular neighborhood of values.

If the optimal value of a variable is zero and the reduced cost corresponding to the variable is also zero, then there is at least one other corner that is also in the optimal solution. The value of this variable will be positive at one of the other optimal corners.

1) Optimal Substructure: A simple solution is to place parenthesis at all possible places, calculate the cost for each placement and return the minimum value. In a chain of matrices of size  $n$ , we can place the first set of parenthesis in  $n-1$  ways.

The basic feasible solution is obtained by solving linear systems of equations. With small changes in data, we solve almost the same system. • If the RHS changes, the solution and the optimal objective change linearly. • If the cost coefficients change, the optimal solution stays the same. • The sensitivity report puts lots of this

We can see that the optimal solution to the LP has value 78750 (£) and that  $T_{ass} = 78750$ ,  $T_{pol} = 78750$ ,  $T_{pac} = 52500$ ,  $X_1 = 0$ ,  $X_2 = 0$ ,  $X_3 = 26250$  and  $X_4 = 0$ . This implies that we only produce variant 3. Note here how much higher the associated profit is than before (£78750 compared with £58000, an increase of 36%!).
